Alliwd Key

- Draen asgell (fin drain) 100mmØ arfaethedig
- Proposed 100mmØ fin drain
- Pibell alffa 100mmØ arfaethedig - cyfeiriwrh at nodyn 2
- Proposed 100mmØ outlet pipe - refer to note 2
- Wal ben alffa arfaethedig - cyfeiriwrh at nodyn 2
- Proposed outlet headwall - refer to note 2
- Siambr archwilio \ twll archwilio arfaethedig
- Proposed inspection chamber \ manhole
- Cronfa ddŵr arfaethedig - cyfeiriwrh at luniad P187-S5-71-09 am fanylion
- Proposed reservoir - refer to drawing P187-S5-71-09 for details
- Flos ddraenio arfaethedig
- Proposed drainage ditch

Notes

1. Drawing shall be read in conjunction with drawings P187-S5-71-02, P187-S5-71-03 and 04 General Arrangement, and Ground Investigation Report - GC3569-RED-74-ATR-RP-D-0005-P03 R/FATR P3.4 & 5 GIR.
2. The exact location and levels of chambers, drain outlets and headwalls shall be determined once vegetation clearance has been completed and existing topography assessed.
3. Chamber covers and frames shall be D400 loading in highway network and D125 loading in pedestrian, verge and landscape areas.
4. Reservoirs will be located at approximately 50m intervals and/or at bottom of slopes to increase infiltration opportunity and prevent ponding at the bottom of the sloped section of the route. They'll also be used to transport flows from the proposed drainage ditches to the adjacent embankments, where flows will be intercepted by vegetation, significantly reducing the speed and quantity of runoff from the site. Refer to the Drainage Strategy and drawing P187-S5-71-09 for details.

Strategaeth Ddraenio - Cam 5

Cymysg defnyddio wneb asfalt hydralid ledled y safle gan ganiatâu i'r cymysg terfynol dynwâr dŵr fo naturol presennol y safle.

Bydd dyluniau yr asfalt hydralid yn amrywio yn dibynnau a yw ar ran wastad y llwybr neu ar ran lethrog y llwybr.

Rhan lethrog

Er mwyn sicrhau bod ar wneb hydralid yn perfomio ar y ran lethrog, bydd flosydd llwybr mawr 2m o hyd, y cyfeiriwr atyn nhw fel 'confeinydd dŵr', gyda chofn fertigol drwy' haenau agreagol tu gweledol y lethr ar y cael eu hadeladu i gynyddu'r cyfeil ymreiddio ac atal pyllau ar waeld y llethr.

Pan fo gan yr arwneb hydralid gyfradd ymreiddiaid uwch na'r presennol gweledol, bydd angen i'r arwneb hydralid gael ei amddiffyn rhag difrod a chynnal diogelwch gweithredol yn ystod amodau rheoliad. Ar hyd y ran lethrog, lle mae'r llwybr yn y ran lenu, bydd unrhyw orienwad yn mynd hr argloddio cyfagos. Lle mae'r llwybr yn y tan tor, bydd flos fas ar ochr isel y llwybr yn dal unrhyw orienwad. Bydd yr flosydd wedyn yn golwg wrth i'r system ymreiddio pan na fyddan nhw bellach yn y ran tor.

Cyfeiriwrh at luniad P187-S5-71-08 am fanylion cynllun yr arwneb hydralid ar hyd y ran lethrog.

Rhan wastad

Pan fo gan yr arwneb hydralid gyfradd ymreiddiaid uwch na'r presennol gweledol, bydd yr arwneb hydralid yn cael ei amddiffyn rhag difrod a chynnal diogelwch gweithredol yn ystod amodau rheoliad trwy gynnwys draen asgell gull'r ffuriant is-sylfaen. Cyfeiriwrh at lun P187-S5-71-07 am fanylion cynllun yr arwneb hydralid ar hyd y ran wastad.

Flat Section

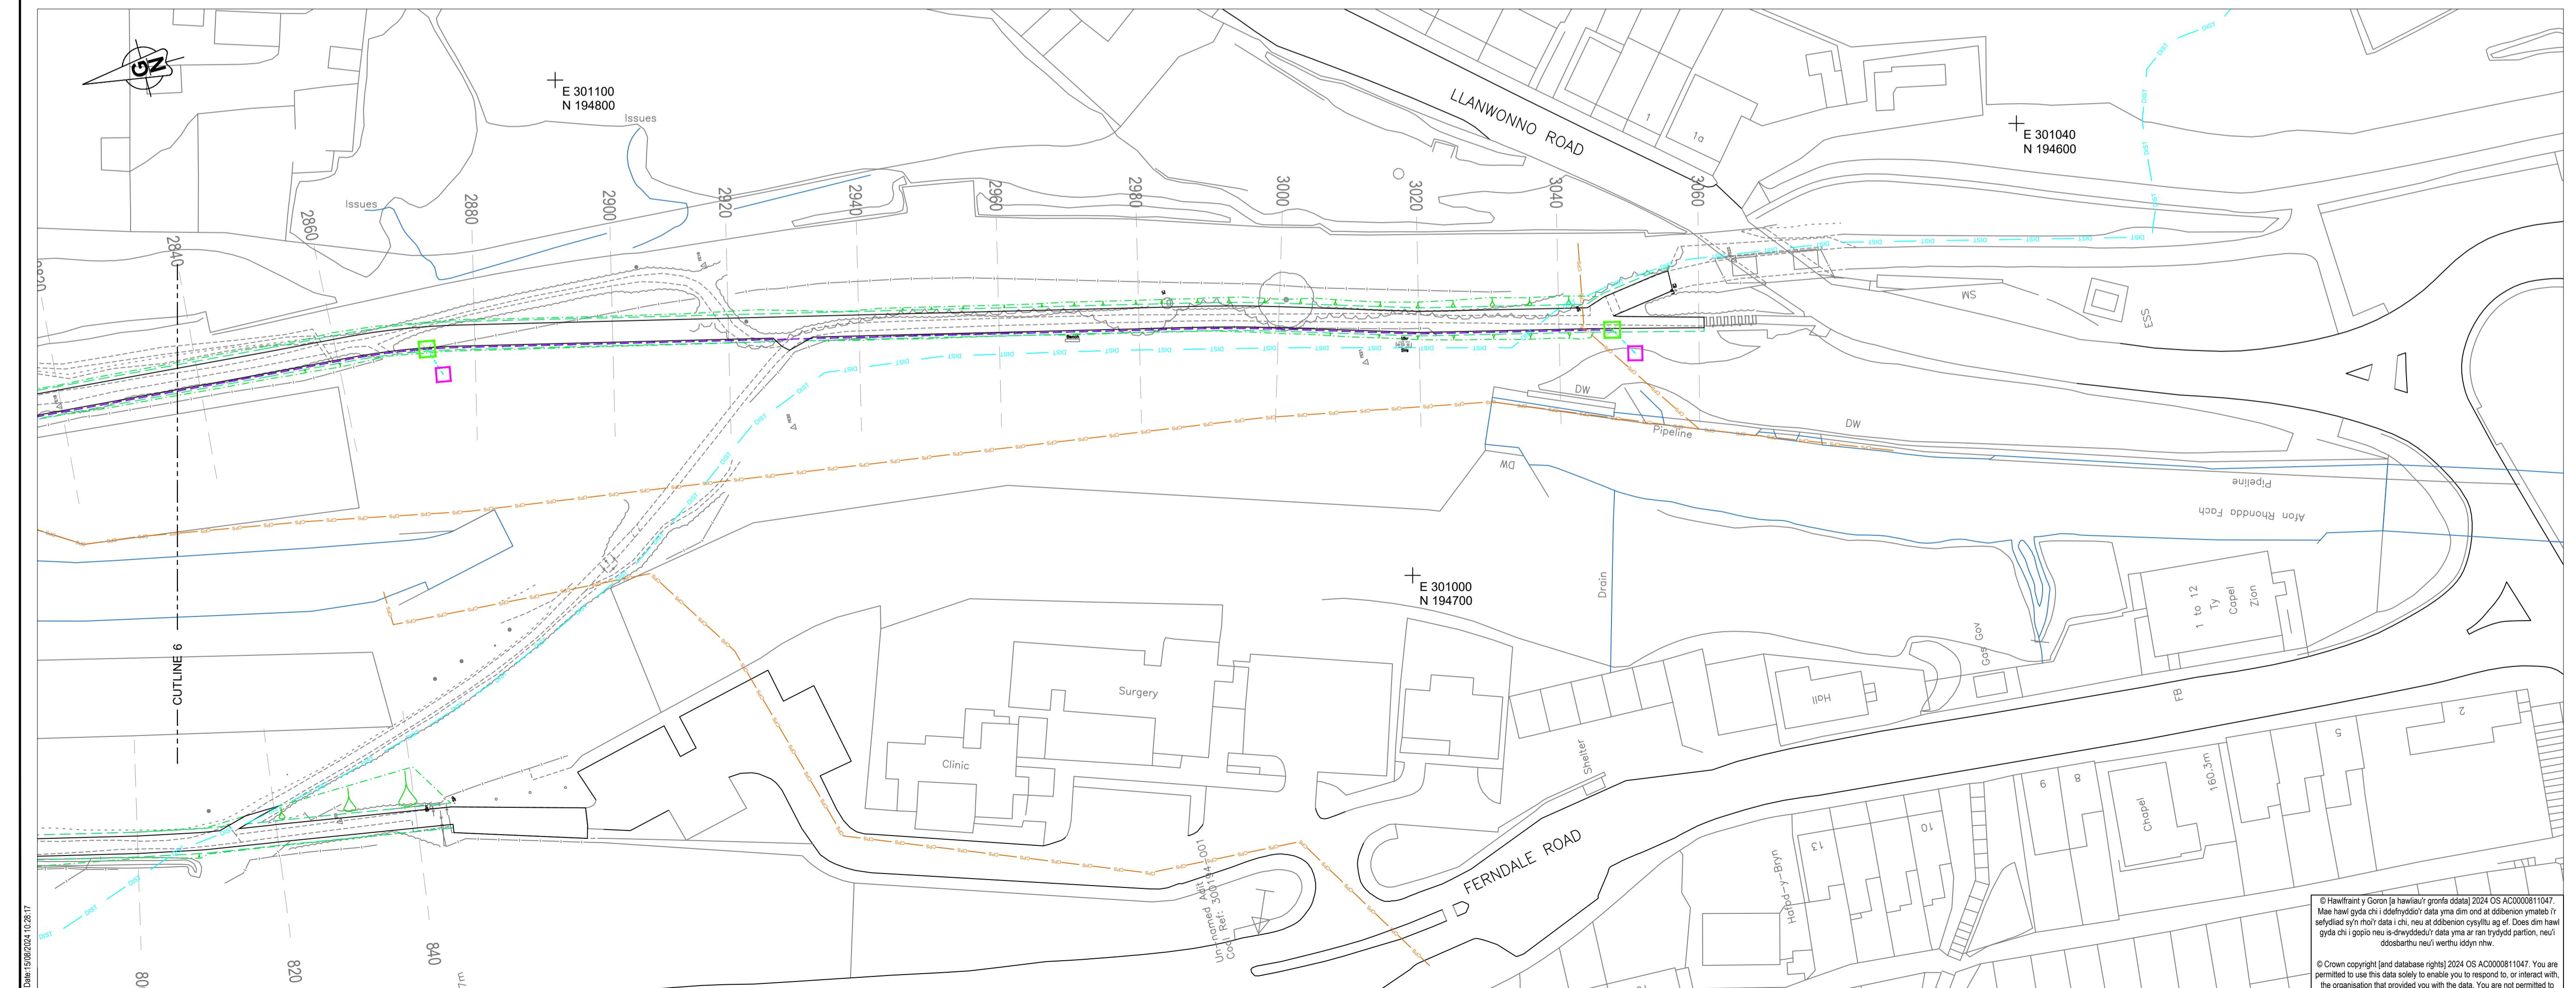

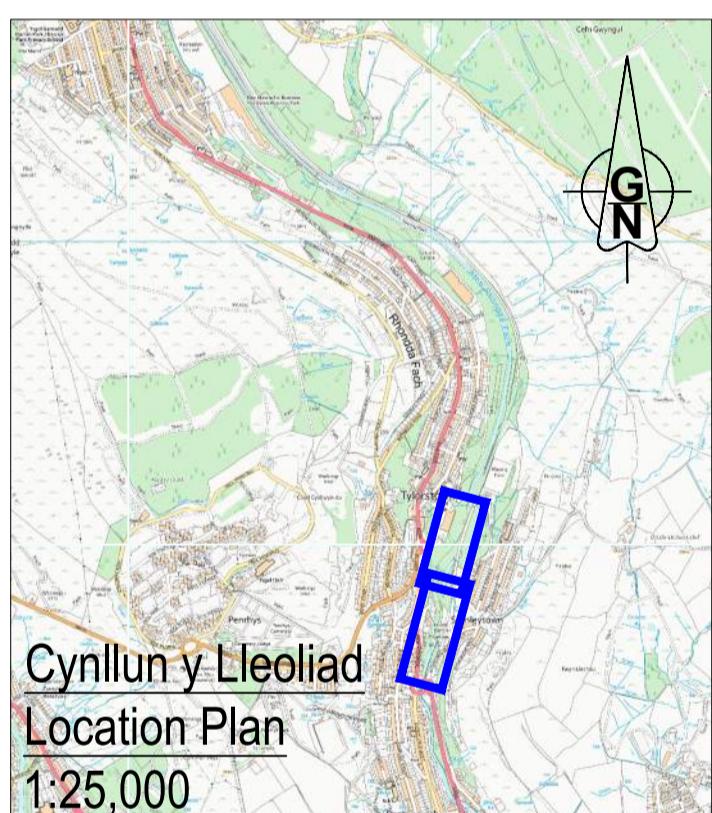

Where the permeable surfacing performs on the sloped section, large 2m long, width of route trenches, referred to as 'reservoirs', with a vertical stalk through the aggregate layers on the down slope side will be constructed to increase infiltration opportunity and prevent ponding at the bottom of the slope.

Where the permeable surfacing has a higher infiltration rate than the underlying existing ground, the permeable surfacing will need to be protected from damage and maintain operational safety during freezing conditions. Along the sloped section, where the route is in fill, any surcharge will discharge to adjacent embankments.

Where the route is in cut, a shallow ditch on the low side of the route will capture any surcharge. The ditches will then discharge back into the infiltration system when no longer in cut. Refer to drawing P187-S5-71-08 for details of the permeable surfacing design along the sloped section.

Flat Section

Where the permeable surfacing has a higher infiltration rate than the underlying existing ground, the permeable surfacing will be protected from damage and maintain operational safety during freezing conditions by the inclusion of a narrow fin drain to the sub-base formation. Refer to drawing P187-S5-71-07 for details of the permeable surfacing design along the flat section.

Nodiadau

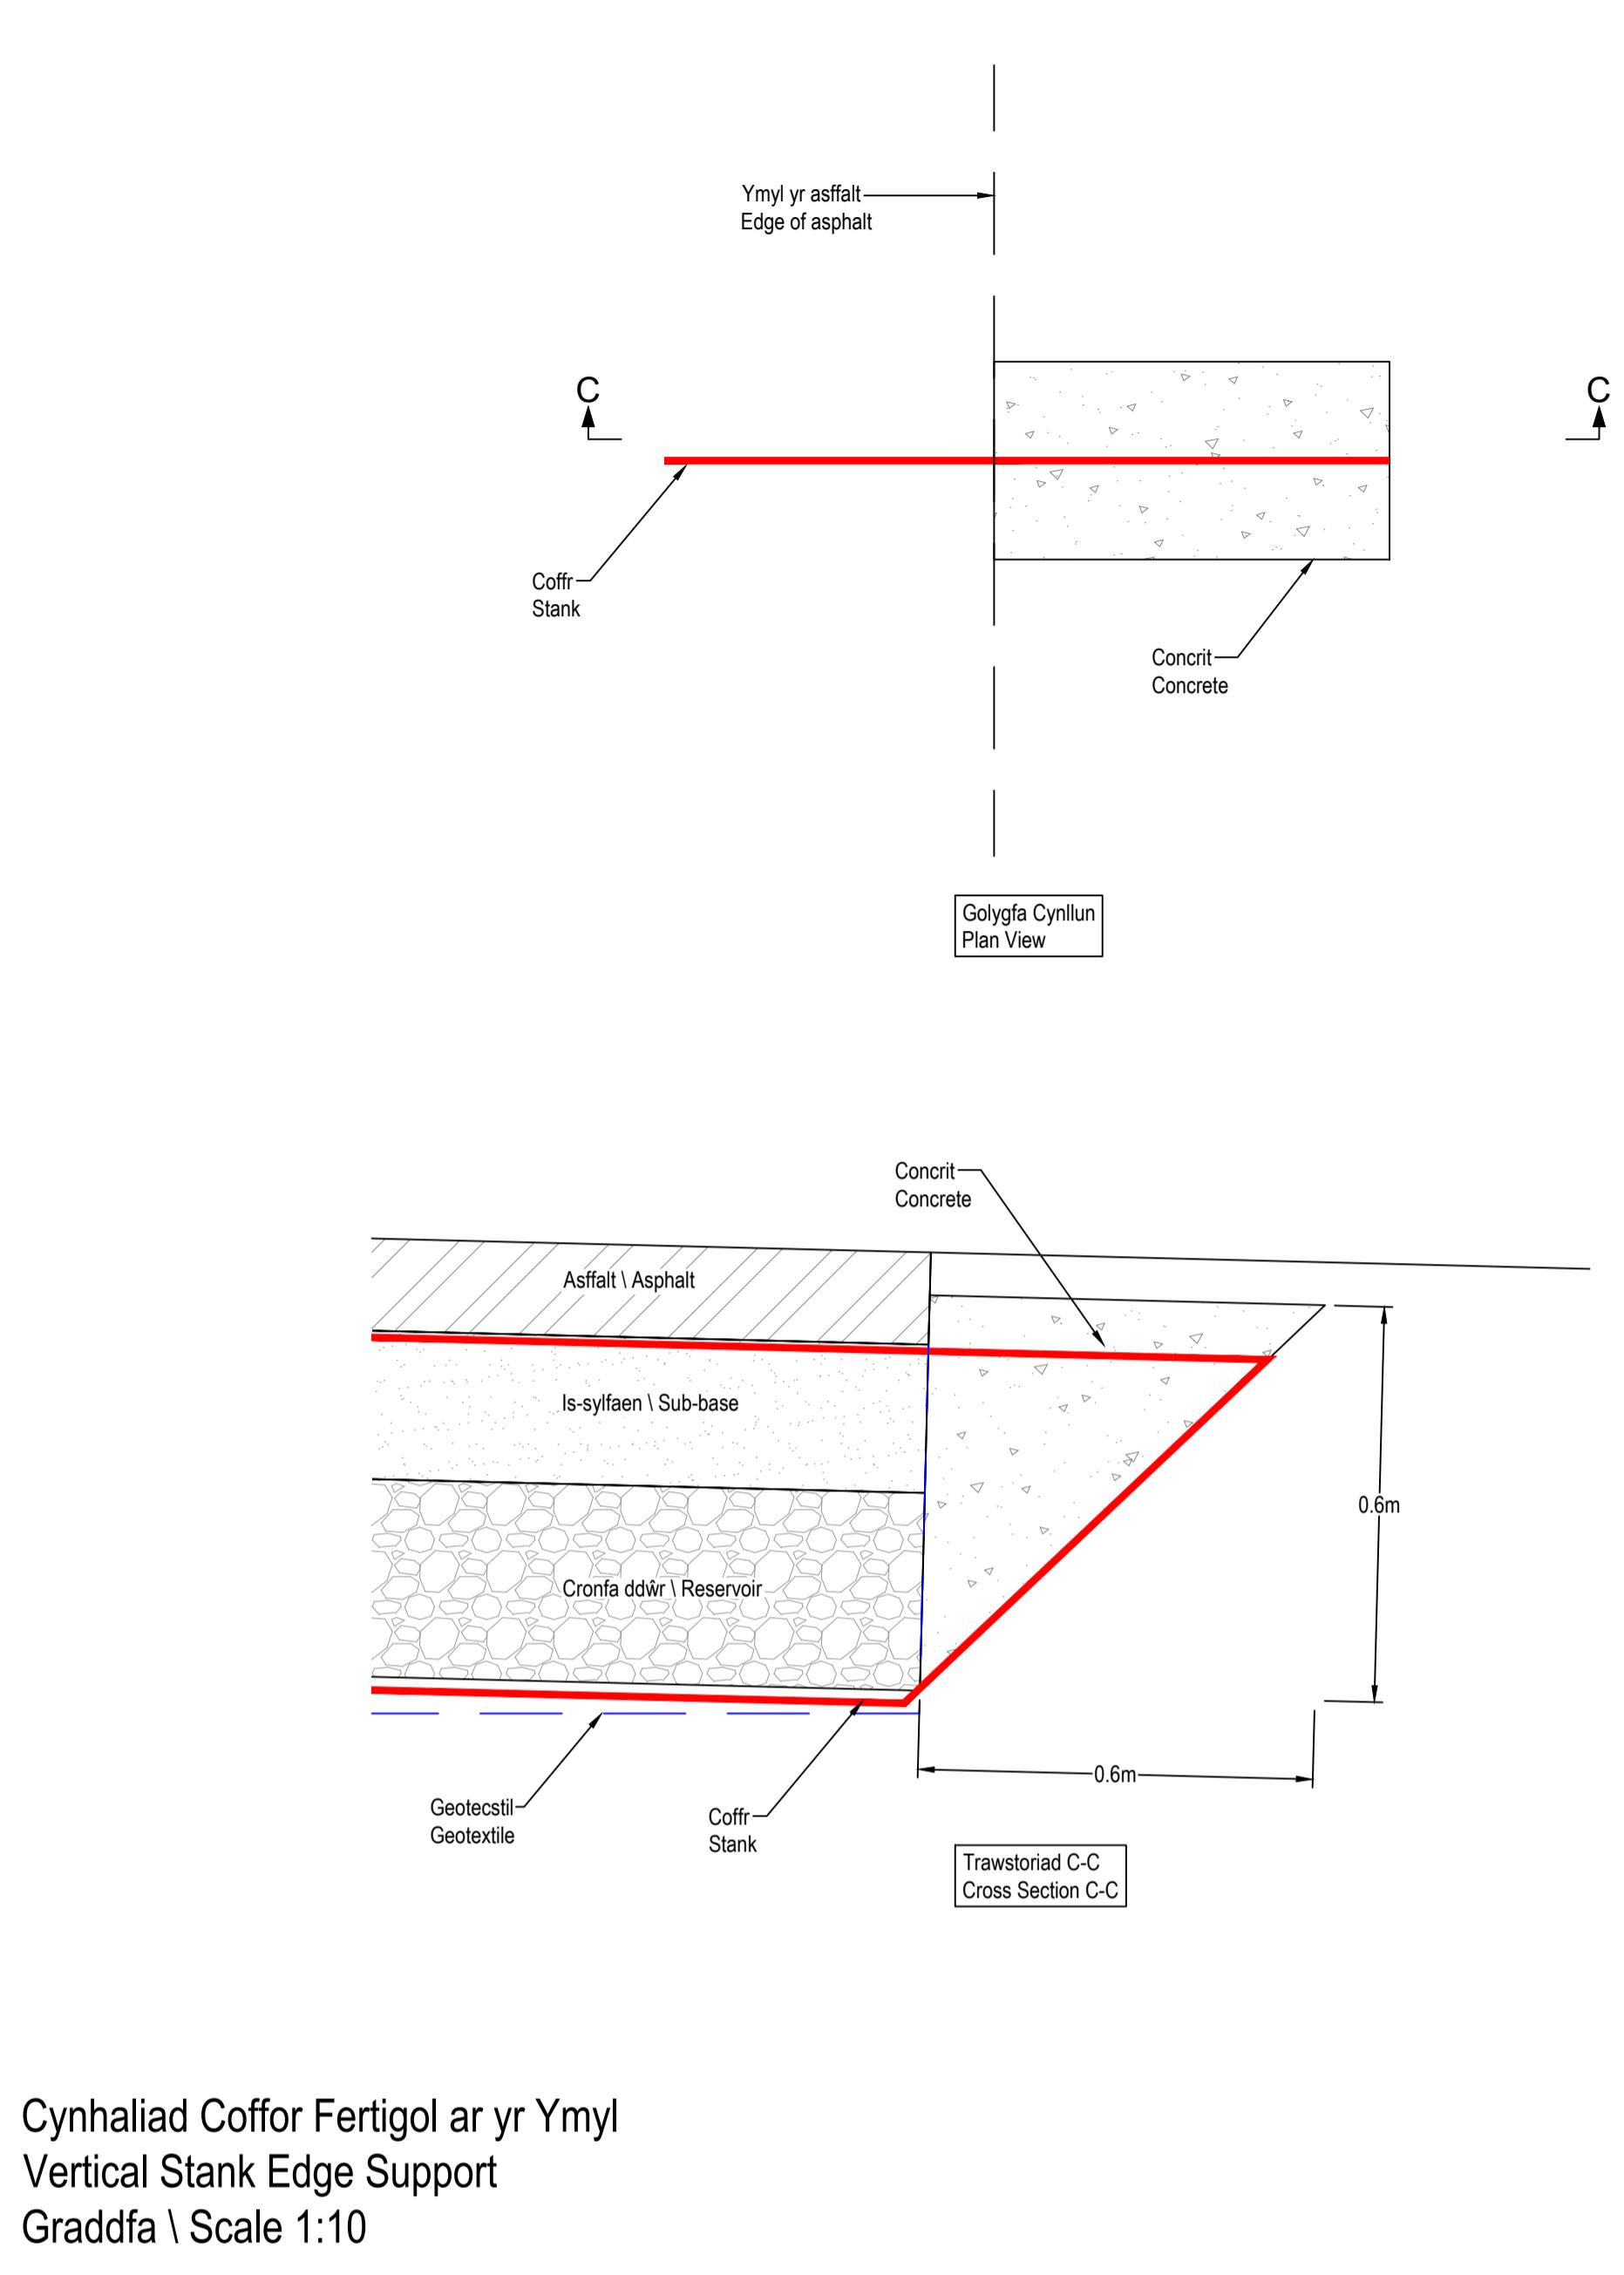

- Ymdreiddiad cynradd trwy is-syfaen
- Ymdreiddiad elaiadd wrth gefn drwy gronfa ddŵr
- Gorlenwad dros y tir lle mae gan yr arwyneb hydraidd gyfradd ymdreiddiad uwch na'r tir gweadolol

Notes

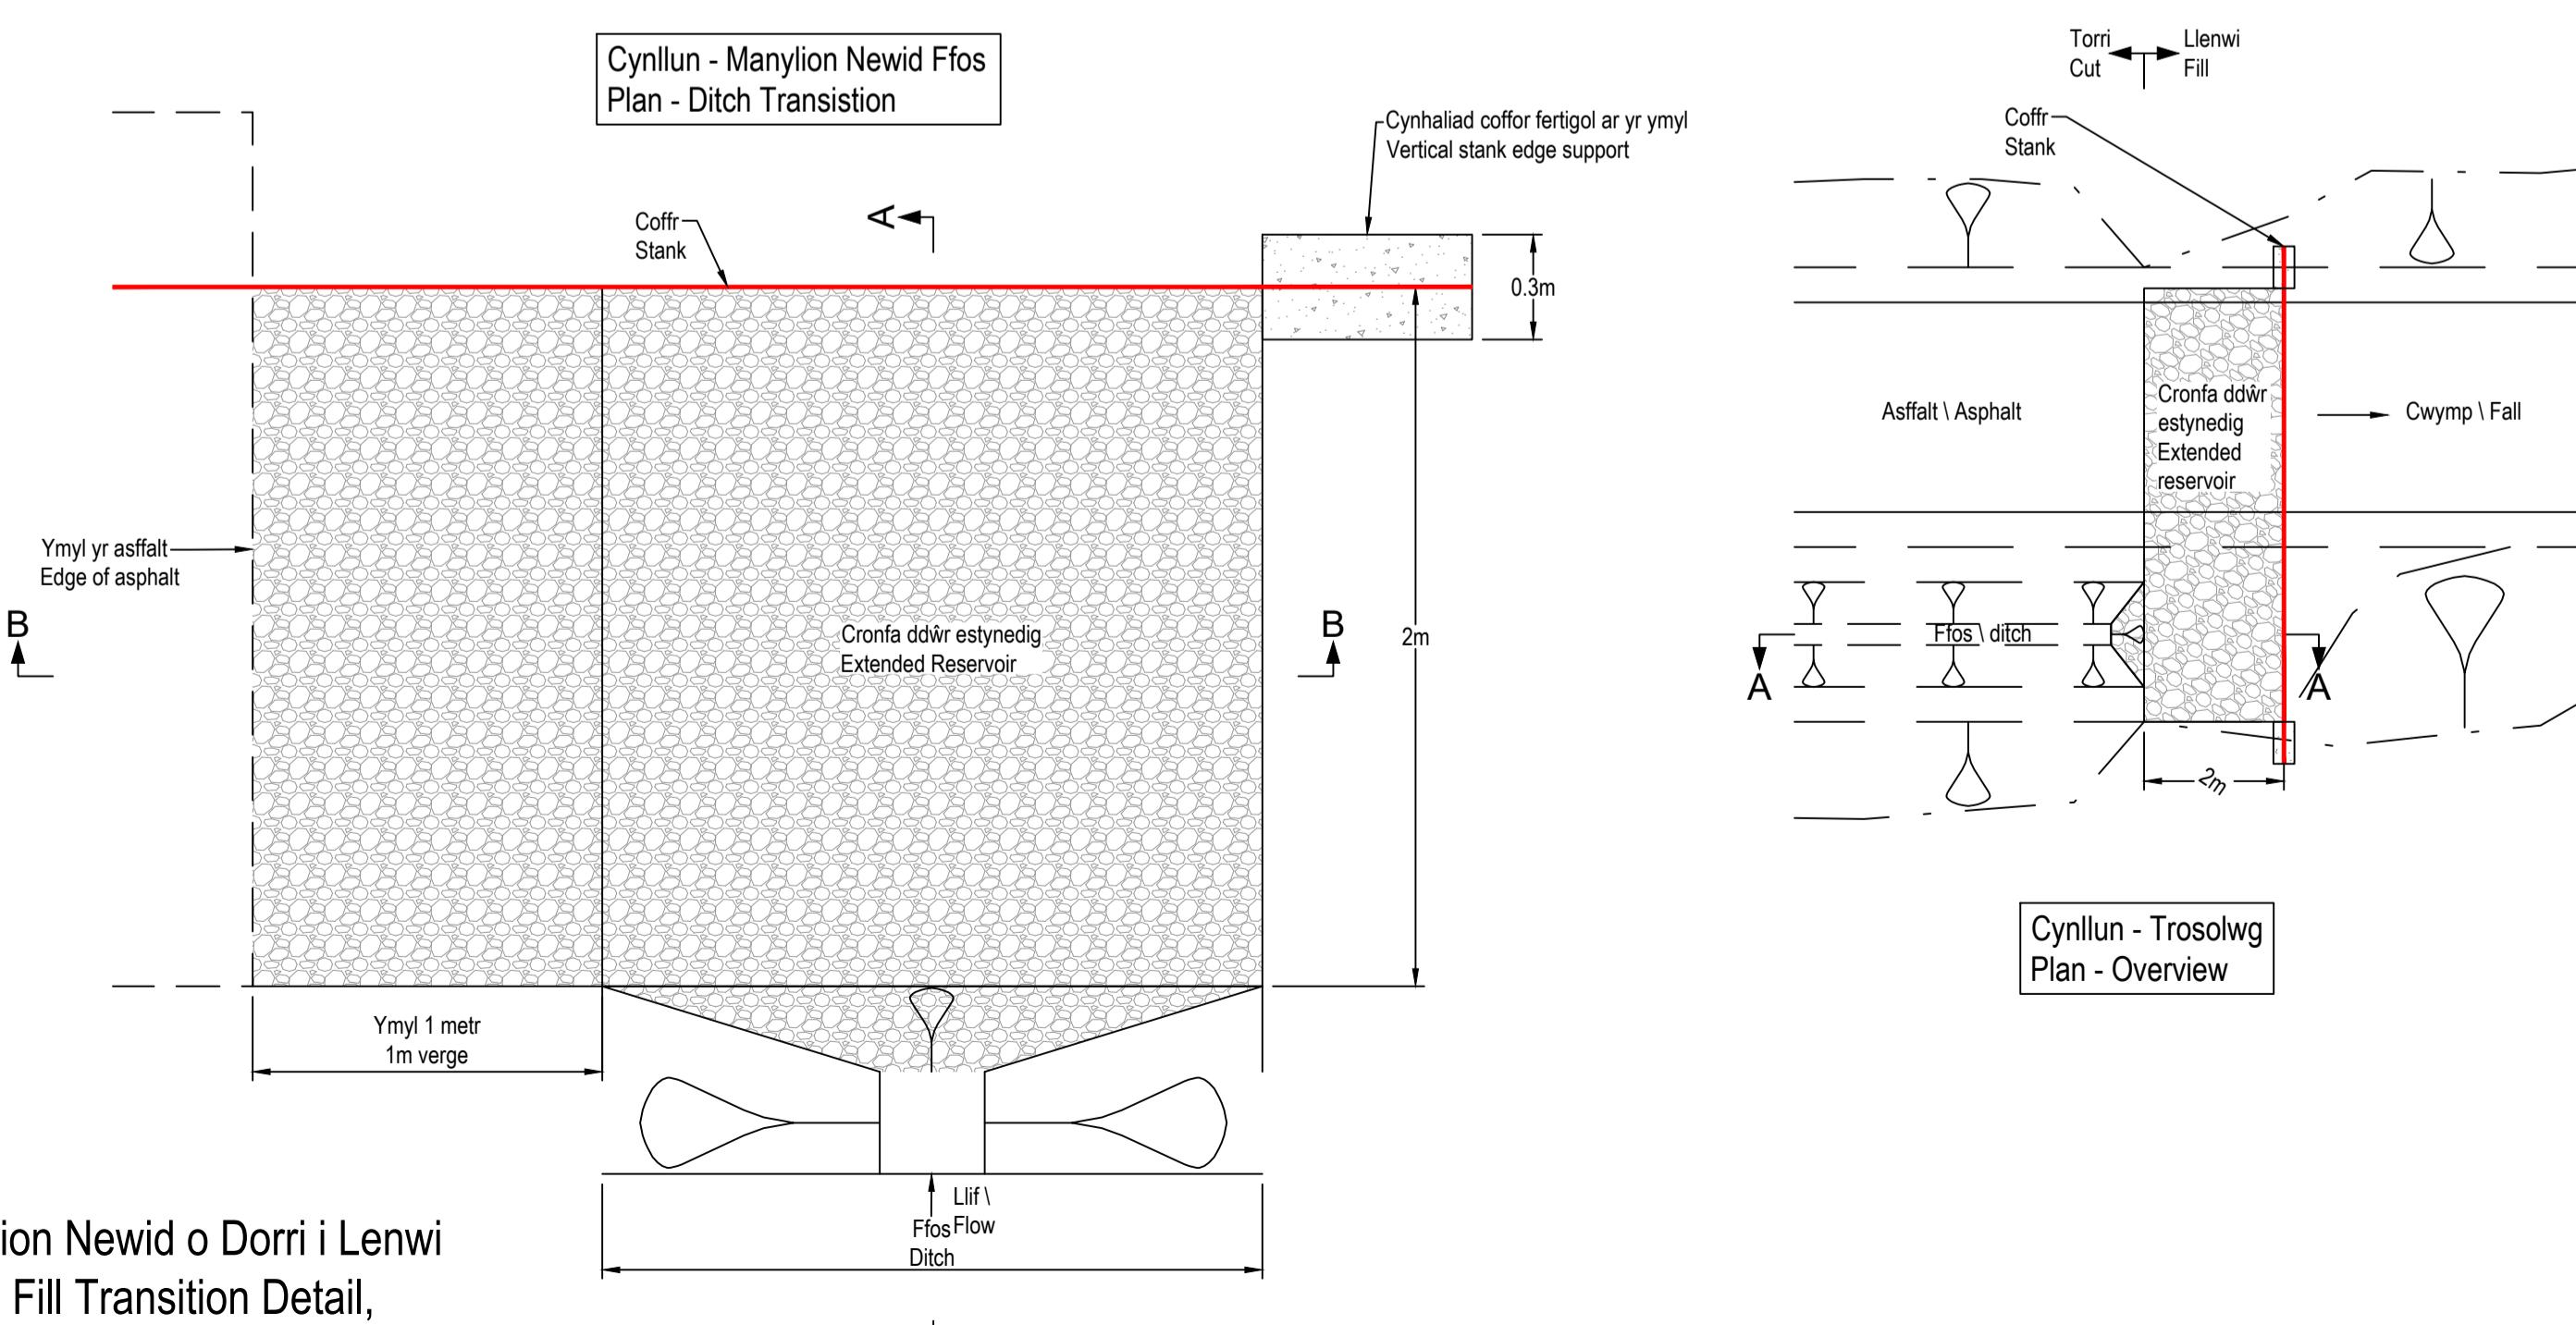

- Primary Infiltration via sub-base.
- Secondary back-up infiltration via reservoir.
- Overland surcharge where the permeable surfacing has a higher infiltration rate than the underlying ground.
